

# P-HAB ( High-Altitude Balloon ) 5V User Manual

DC input use DC 9V ~12V

## 1. Enable serial Port

### Raspberry Pi Serial Port Usage

The serial port on the Raspberry Pi is configured as default for console input/output. This allows you to login and interact with the Raspberry Pi via the serial port but you cannot use the serial port with your programs. To use the serial port with other programs and hardware such as modems, arduino boards etc you need to disable the console login.

### To Disable Serial Port Login

You need to edit two files in order to use the serial port with your own programs. When the Raspberry Pi boots, the bootup information is sent to the serial port. You can disable this by editing the **/boot/cmdline.txt** file. The contents of the file look like this

```
dwc_otg.lpm_enable=0 console=ttyAMA0,115200
kgdboc=ttyAMA0,115200 console=tty1 root=/dev/mmcblk0p2 rootfstype=ext4
elevator=deadline rootwait
Remove all references to ttyAMA0 so the file looks like this:
dwc_otg.lpm_enable=0 console=tty1 root=/dev/mmcblk0p2 rootfstype=ext4
elevator=deadline rootwait
Save the file to save your changes.
The second file to edit is /etc/inittab
Edit using: sudo nano /etc/inittab
The /etc/ inittab file has the command which enables the login prompt which
needs to be disabled.
Near the end of the file will be a line similar to this:
respawn:/sbin/getty -L ttyAMA0 115200 vt100
Disable this line by adding a # character to the beginning.
#respawn:/sbin/getty -L ttyAMA0 115200 vt100
Save the file.
You should then reboot your raspberry pi with the following command
```

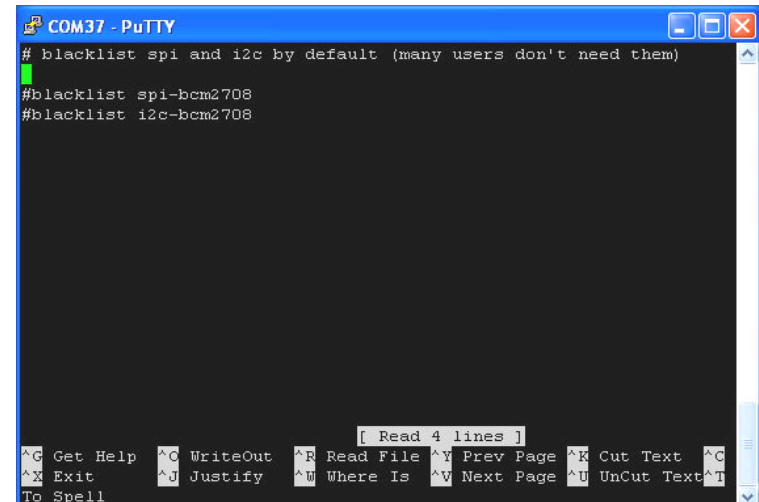

**sudo shutdown -r now**

Serial port setting detail in our web site

<http://www.pridopia.co.uk/rs-pi-set-serial.html>

1. Make sure your I2C driver are enable  
To enable it all you need to do is comment out a line by putting # in front

```
sudo nano /etc/modprobe.d/raspi-blacklist.conf
```

2. Add i2c-dev in /etc/modules by use  
sudo nano /etc/modules

```
192.168.0.13 - PuTTY
GNU nano 2.2.6 File: /etc/modules Modified

## /etc/modules: kernel modules to load at boot time.
#
# This file contains the names of kernel modules that should be loaded
# at boot time, one per line. Lines beginning with "#" are ignored.
# Parameters can be specified after the module name.

snd-bcm2835
spi-bcm2708
i2c-bcm2708
i2c-dev
rtc-ds1307
```

3. Next install the python-smbus python module:

**sudo apt-get install python-smbus**

**sudo apt-get install i2c-tools**

Now you are ready to use the i2c with python.

**If you already install I2c driver ,**

**i2cdetect -y 1 - for Raspberry Pi V2 Board**

```

Download HAB software

wget <http://pridopia.co.uk/pi-pgm/Installer-hab.tar>

tar xf Installer-hab.tar

python Install.py ---- install necessary software for HAB

python Install-Edu.py -- install eduhab auto-login-autorun

The eduhab.py send GPS location, tmp102, DS18B20, BMP085, DHT22 information through FM UHF Transmitter, the eduhab.py have 3 commands

eduhab.py -s short data stream mode send GPS location and BMP085 Temp only ,

but all logs save to SD card

eduhab.py -p send data also take photos every 30sec

eduhab.py -c prid change the data stream "twick" to "prid"

- 18B20 1-wire Temp sensor have problem when working together with camera, if you don't use camera you can use 18b20 Temp sensor.
- DHT22 use GPIO 17 , we change to i2c base  
HTU21D Digital Temp & Humidity Sensor

If you don't have "BMP085", & "HTU21D" sensors setting to False in eduhab.py

```

eduhab.py - WordPad
File Edit View Insert Format Help

#####
TESTING = False ## If you want to test the Cut Off, Enable this (True).
#####

GPIO.setmode(11)
GPIO.setwarnings(False)
GPIO.setup(CutOff, GPIO.OUT)

Devices = {
    "BMP085": True,
    "TMP102": True,
    "HTU21D": True,
    "DS18B20": False
}

```

## Test & Monitor program

Win xp [sdr-inatl.zip](#) [dl-fldigi-dl3.1](#) [VBCABLEDriver\\_PAck42b](#)

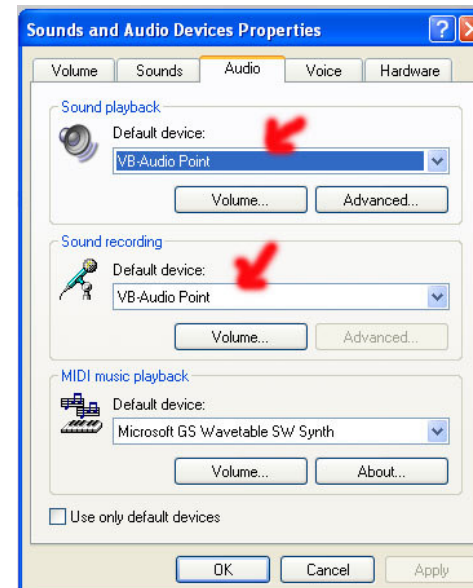

## Install VBCable Driver

## Install VBCable Audio Driver

Software will auto detect your OS -- WinXP

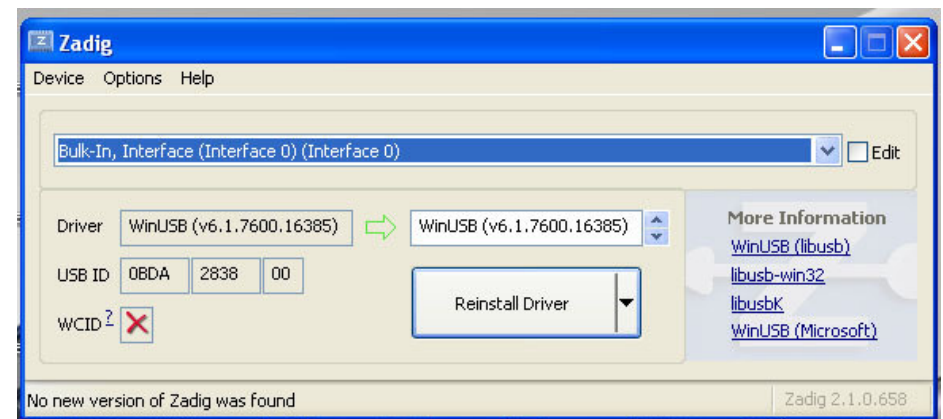

Click "Install Driver"

In Setting-> control panel -> Sounds and Audio Devices

Audio -> Sound playback -> VB-Audio Point

Audio -> Sound recording -> VB-Audio Point

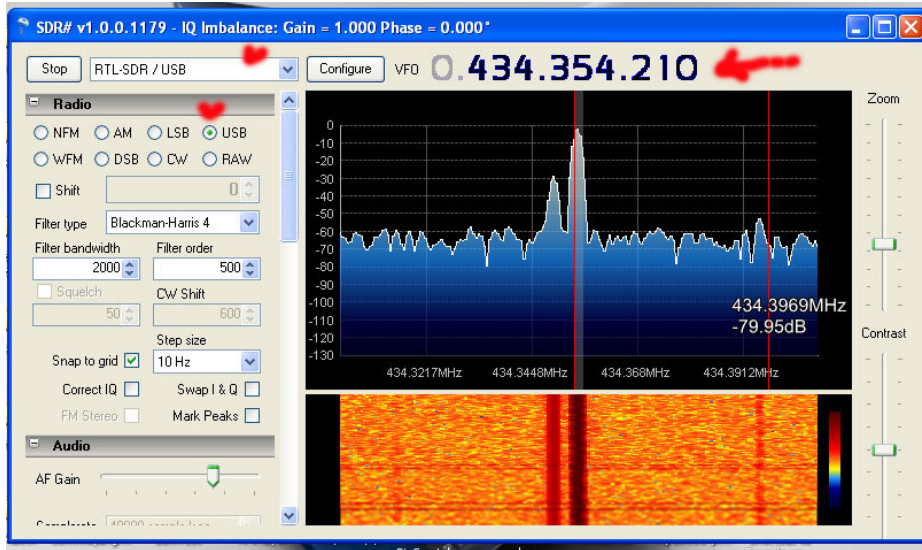

In options choose List all Devices ->

Choose Bulk-In, Interface (Interface0) (Interface0)

Click "Install Driver"

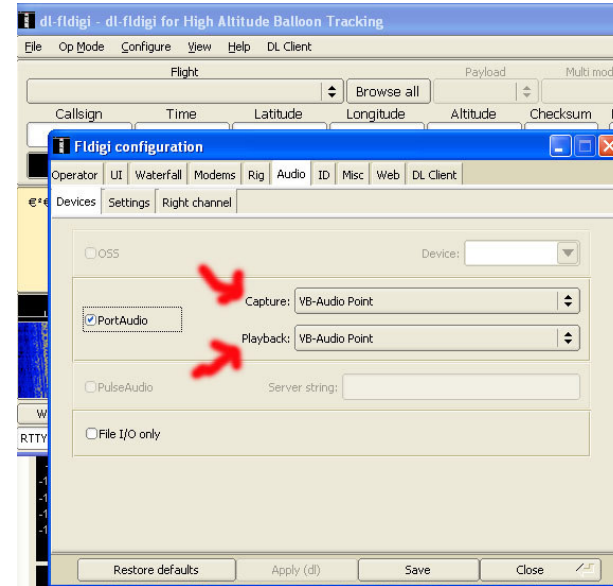

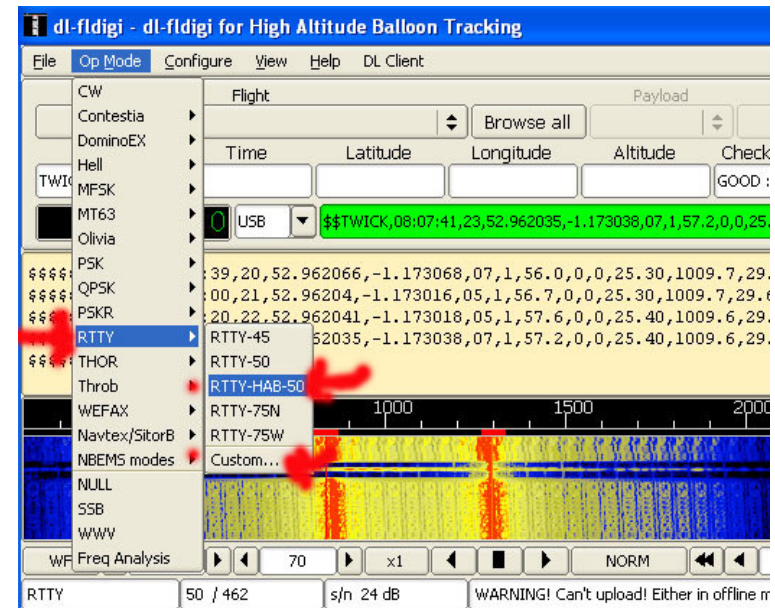

Choose RTL-SDR /USB → radio choose USB -> Click “Play”

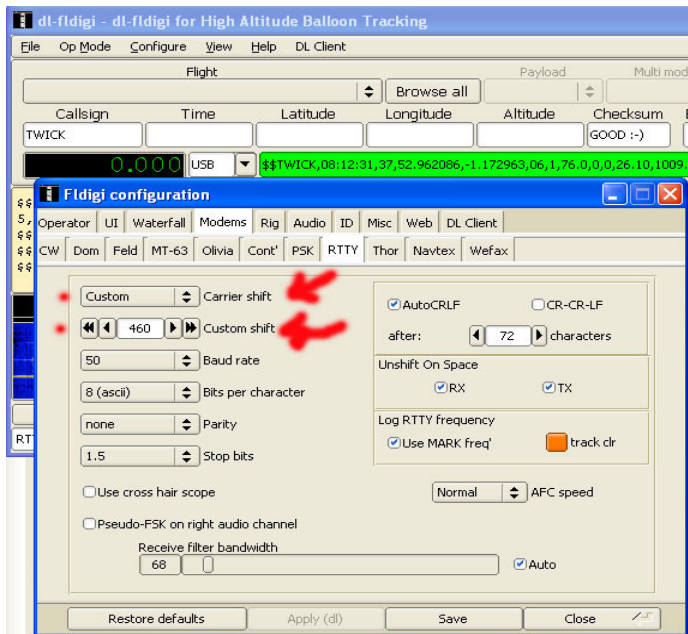

Adjust the wide and Contrast

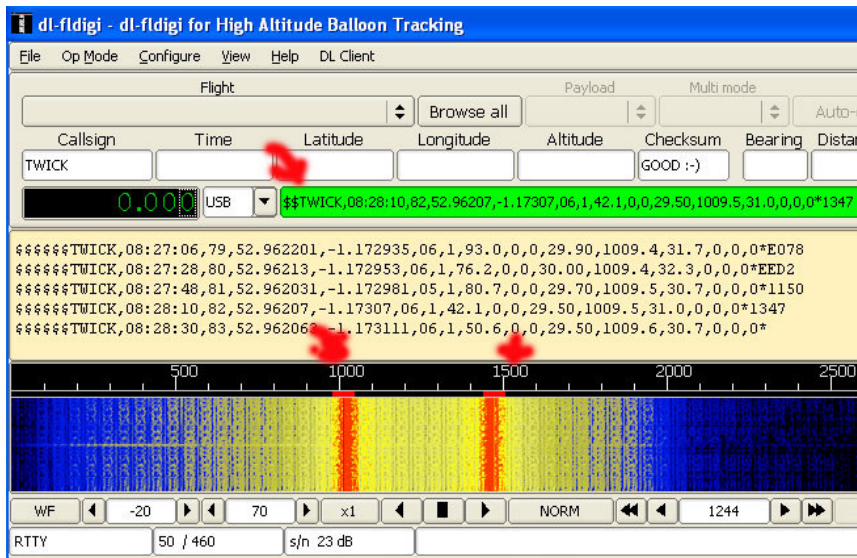

In configure -> Sound card → PortAudio  
Capture : choose VB-Audio Point  
Playback: choose VB-audio Point

Choose RTTY -> RTTY HAB-50-> & Custom

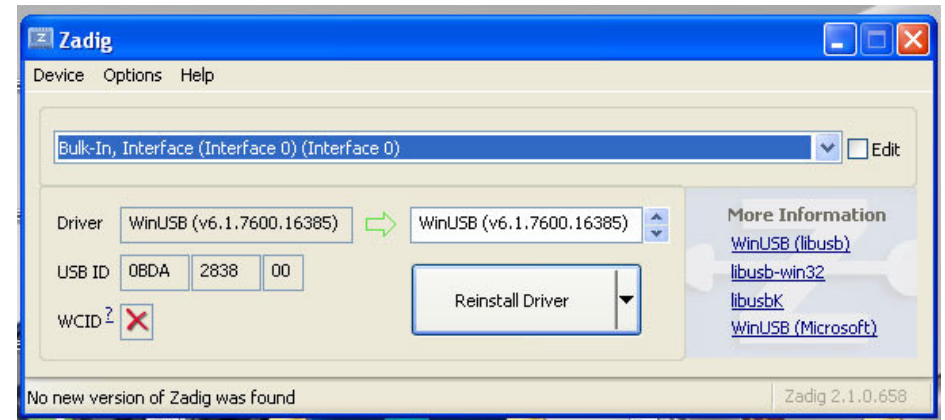

Change shift to about 455 ~ 460

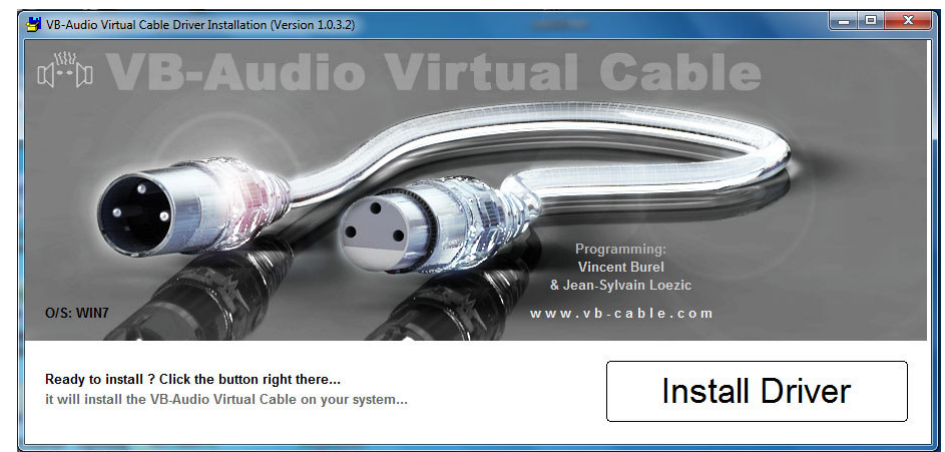

## Win7 Setting

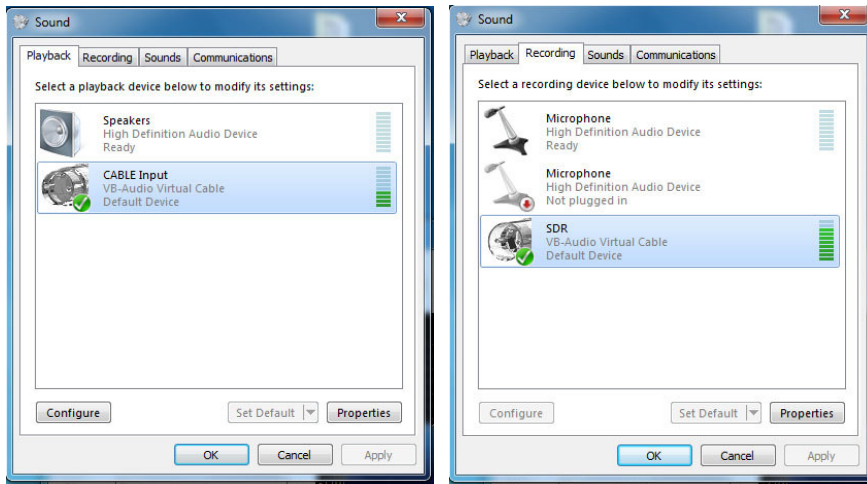

### Install Zadig

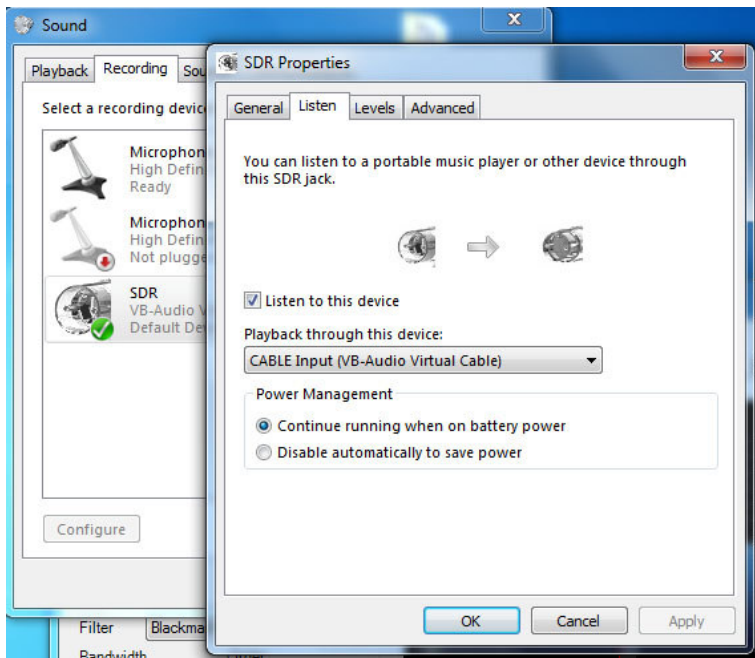

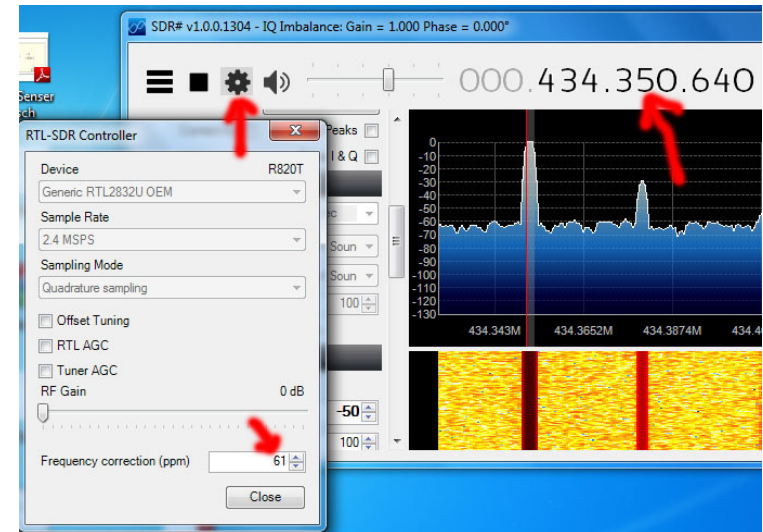

In options choose List all Devices ->  
Choose Bulk-In, Interface (Interface0) (Interface0)  
Click "Install Driver"

Install VBCable Audio Driver  
Software will auto detect your OS -- Win7  
Click "Install Driver"

Setting Cable Input as default & SDR as default in “Recording”

In Listen choose playback through this device as “CABLE Input (VB-Audio Virtual Cable)”

Adjust Frequency correction(ppm) as the label in NTX2B-FA 434.xxx
